

Follow-up Question to October 18, 2011 Foothills Shipper Meeting

Question:

“How will the incremental fuel usage (as a result of the waste heat project) be credited to shippers”

Answer:

NGTL estimates the incremental fuel consumption associated with the Crowsnest Waste Heat Project to be less than 76 GJ/d or approximately 20,000 GJ/year considering outages and average annual conditions.

This estimation is based on assumptions from the design specifications and actual usage will be determined upon completion of construction.

All incremental fuel will be charged monthly to the plant operator at the weighted average of the NGTL AB-NIT Same Day Index. Money received as reimbursement for fuel costs will be credited back to Shippers in the OM&A accounts. An update on the actual fuel usage and revenue requirement credit will be presented at the Foothills shipper meeting each fall.

If you have further questions or concerns, please contact Bruce Newberry at (403) 920-5579 or Dan Ronsky at (403) 920-5581.
